                                                                                 This is the amino acid sequence of the N-terminal, i.e. the extracellular, domain of novel human transmembrane activator and extracellular, domain of novel human transmembrane activator and cartracellular, domain of novel human transmembrane activator and matcheractor (TACI) protein (see AAM75783). TACI is a lymphocytes and to a much lesser extent it is normally present in B-lymphocytes, and to a much lesser extent in immature T-lymphocytes, and can therefore be targetted to specifically regulate B cell responses without affecting T cell activity. The extracellular domain of TACI functions as a binding site for a ligand that stimulates the activation of the cell by inducing the binding of the C-terminal portion (see AAM75784) of TACI to the N-terminal domain of CAMI. A recombinant form of the extracellular portion of TACI acts as a dominant-negative or blocking agent and acts to suppress the immune system. It can be used to treat or prevent autoimmune disease, graft rejection or graft versus host disease. The extracellular region is also used in a claimed method for identifying a ligand for TACI, in which binding of a candidate molecule is determined by detecting cellular activation of the AP-1, CAMP or NF-KB pathway, of NF-AT transcription.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        TCAAFCRSLSCRKEQGKFYDHLLRDCISCASICGQHPKQCAYFCENKLRSPVNLPPELRR 120

                                                                                                                                                                                                                                                                                                                                                                          The invention relates to methods of using one or more agonists or antagonists to modulate the activity of the members of TNF (tumour necrosis factor) especially TALL-1, APRIL and TNF receptor (TNFR) e.g. TACI or BCWA. The method is useful for treating pathological conditions or diseases associated with increased TALL-1 and APRIL expression or activity. TALL-1 and APRIL antagonists are used to block the interaction between APRIL and TALL-1 with TACI or BCWA. They are useful for treating a mammal suffering from cancer such as leukaemia, lymphoma, myeloma, cancers of lung and colon and autoimmune diseases e.g. rheumatoid arthritis, multiple sclerosis, proclassis and lupus erythematosus. The present sequence is human
                                                                                                                                                         Inhibiting or neutralizing TALL-1 or APRIL polypeptide biological activity, for treating autoimmune disorders and cancer, comprises exposing the cells to TALL-1 or APRIL polypeptide agonists or

TACI is normally present in B-lymphocytes, and to a much lesser extent in immature T-lymphocytes, and can therefore be targetted to specifically regulate B cell responses without affecting T cell activity. TACI cDNA (seev57328) was isolated from a B-lymphocyte countries. Tacing a yeast two-hybrid assay. Also claimed are activity. TACI cDNA (seev57328) was isolated from a B-lymphocyte con TACI and a B-lymphocyte, unique assay. Also claimed are the C-terminal (see AAM75784) and N-terminal (see AAM75785) fragments of TACI. Tecombinant DNA constructs, unicellular hosts, and antibodies to TACI and for identifying immunosuppressive drugs that is selectively block the action of B lymphocytes without affecting mature T lymphocytes. TACI can be activated to increase immune system activity, e.g. for treating infections or cancers. It can be blocked to provide immunosuppression, e.g. for treating a louced vasculitis, glomerulonephritis, haemolytic anamia, myssthenia gravis, type II collagen-induced arthritis, experimental systemic lupus extythematosus, transplant rejection, cancer or systemic lupus extythematosus, transplant rejection, cancer or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

TR17 has cytostatic, immuposuppressive, nocroprofective, antiviral, antiallergid, hepatotropic, antidiabetic, antinflammatory, antilucer, cardiant and ophthalmological activities and can be used in gene therapy. The TR17 protein and antibodies are useful for treating and diagnosing immunodeficiency
                                                                                                             Human; neutrokine-alpha binding protein; NAR protein; TR17; cytostatic; immunosuppressive; nootropic; neuroprotective; antivital; antiallergic; hepatotropic; antidiabetic; antiinflammatory; antidicer; cardiant; ophthalmological; gene therapy; immunodeficiency disorder; diagnosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                disorders and autoimmune disorders. The TR17 polypeptides, polynucleotides, antibodies, agonists and/or antagonists are used for treating various other diseases defined in the specification and as research tools for studying the phenotypic effects that result from inhibiting TR17/TR17 ligand interactions on various cell types.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      TCAAFCRSLSCRKEQGKFYDHLLRDCISCASICGQHPKQCAYFCENKLRSPVNLPPELRR 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Nucleic acid encoding a neutrokine-alpha receptor (NAR) such as TRI7, useful for producing TRI7 protein which is used in the treatment and diagnosis of autoimmune and immunodeficiency disorders -

AAE09240;

Human TACI protein.

Human; TNF; tumour necrosis factor; TALL-1; APRIL; TNF receptor; TNFR; TACI; BCMA; therapy; cancer; leukaemia; myeloma; lymphoma; autoimmune disease; rheumatoid arthritis; multiple sclerosis;

```
The present sequence represents a human transmembrane activator and CAML-interactor (TACI) receptor. TACI is a tumour necrosis factor (TACI) receptor. TACI is a tumour necrosis factor (TAE) receptor. The extracellular domains of BR43x2 (an isoform of TACI), TACI or BCMA (a related B cell protein) receptor contain a cysteine rich domain, and are used for inhibiting ztnf4 activity. Ztnf4 is a TNF receptor-ligand engagement associated with activated or resting B lymphocytes, effector T-cells, or with antibody production. The rutibody production is associated with an autoimmune disease selected from systemic lupus erythematosus, myasthemia gravis, multiple sclerosis and rheumatoid arthritis. The ztnf4 activity and BR43x2, TACI or BCMA ceceptor-ligand engagement is associated with asthma, bronchitis, emphysema, end stage renal failure, glomerulonephritis, vasculitis, is emphysema, end stage renal failure, glomerulonephritis, vasculitis, is the chain receptor-ligand engagement is enablasms, multiple myelomas, lymphomas, lymth chain receptor-ligand engagement and receptor-ligand engagement and receptor-ligand engagement is associated with asthma, bronchitis, emphysema, end stage renal failure, glomerulonephritis, vasculitis, is the chain receptor-ligand engagement and receptor-ligand enga
                                                                                                                                                                                                                          transmembrane activator and CAML-interactor; tumour necrosis factor; ztnf4 activity; antibody production; autoimmune disease; amyloidosis; systemic lupus erythematosus; myasthenia gravis; multiple sclerosis; rheumatoid arthritis; asthma; bronchitis; emphysema; pyelonephritis; end stage renal failure; glomerulonephritis; wasculitis; nephritis; repail neoplasm; multiple myeloma; lymphoma; light chain neuropathy; immune response; immunosuppression; graft rejection; joint pain; graft versus host disease; inflammation; swelling; anaemia; septic shock; insulin dependent diabetes mellitus; Crohn's disease; hypertension; renal artery stenosis; occlusion; cholesterol; renal emboli.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          light chain neuropathy, anyloidosis, moderating immune response, immunosuppression, graft rejection, graft versus host disease, inflammation, insulin dependent diabetes mellitus, Crohn's disease, joint pain, swelling, anaemia, or septic shock. BR43x2, TACI, and BCMA polypeptides, fusions, antibodies, agoniëts or antagonists can be used to treat hypertension, renal artery stenosis, or occlusion, and
                                                                                                                                                                                              Human; BR43x2; TACI receptor; extracellular domain; BCMA; B cell protein;

Inhibiting or neutralizing TALL-1 or APRIL polypeptide biological activity, for treating autoimmune disorders and cancer, comprises exposing the cells to TALL-1 or APRIL polypeptide agonists or

Example 1; Fig 1; 160pp; English.

antagonists

```
The invention relates to methods of using one or more agonists or antagonists to modulate the activity of the members of FNF (tumour necrosis factor) especially TALL-1. APRIL and TNF receptor (TNFR) e.g. TACI or BCMA. The method is useful for treating pathological conditions or diseases associated with increased TALL-1 and APRIL expression or activity. TALL-1 and APRIL antagonists are used to block the interaction between APRIL and TALL-1 with TACI or BCMA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              They are useful for treating a mammal suffering from cancer such as leukaemia. Imphoma, myeloma, cancers of lung and colon and autoimmune diseases e.g. rheumatoid arthritis, multiple sclerosis, psoriasis and lupus erythematosus. The present sequence is human

TACI (Transmembrane activator and calcium-signal modulating protein. TACI (Transmembrane activator and calcium-signal modulating alpha polypeptide (TACI-Ligand). The antagonist or agonist of TACI/TACI-L complex is useful for modulating an intracellular signalling cascade mediated by TACI/TACI-L complex. Antagonists of TACI/TACI-L complex are used to inhibit the interaction between TACI and TACI-L for therapeutic purposes to treat tumnour and tumnour metastasis and to combat various autoinmune diseases e.g. multiple sclerosis and diabetes, as well as other disorders, such as viral infection, rheumatoid arthritis, and inflammation. The interaction is used to study cellular processes associated with tumnour necrosis factor (TNF)-receptors such as immune required to the compation, cell proliferation, cell death and inflammatory responses.

The present sequence represents murine ztnf4, a tumour necrosis factor ligand. The extracellular domains of BR43x2 (an isoform of the cransmenbrane activator and CAML-Interactor (TACI) receptor). TACI or ECCH (a related B cell protein) contain a cysteine rich domain, and are used for inhibiting ERASA; ARCI or ECCHA receptor-ligand engagement associated with activated or resting B lymphocytes, effector T-cells, or with antibody production. The antibody production is associated with an autibody production. The antibody production is associated with an autibody production. The antibody production is associated with an autibody production. The antibody production is associated with a subtimule disease selected from systemic lupus erythematosus, myasthenia gravis, multiple sclerosis and rheumatoid arthritis. The zinf4 activity and BR43x2, TACI or BCMA receptor-ligand engagement is associated with a sthma. Dronchitis, emphysems, end stage renal failure, capture, and erating immune response, immunosuppression, graft capture, and erating immune response, inflammation, insulin dependent diabetes mellitus, Crohn's disease, inflammation, insulin dependent capture shork. BR43x2, TACI, and BCMA polypeptides, fusulos, antibodies, agonists or antagonists can be used to treat hypertension, renal artery stenosis, or occlusion, and cholesterol or renal emboli.
                                                                                                                                                                                                                                                                                         renal disease, graft versus host disease, and inflammation, comprises administering a BR43x2, TACI or BCMA extracellular domain polypeptide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               7;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Nucleic acids encoding TANGO polypeptides are useful as modulating agents for regulating cellular processes like asthma, graft versus-host diseases, rheumatoid arthritis, postnasis, inflammatory bowel disease, septic shock, ulcerative colitis, conn's disease, chronic myelogenous leukemia, cancer, liver disease, Hodgkin's chronic myelogenous leukemia, cancer, liver disease, Hodgkin's chronic myelogenous leukemia, cancer, liver disease, Hodgkin's chiseases e.g. myasthemia cancer, liver diseases, cachexia and autoimmune diseases e.g. myasthemia acids are also useful for producing transgenic animals and the TANGO polypeptides themselves. Partial TANGO-128, 140, 197, 213, 224, 239 sequences are useful in forensic biology, for diagnostic assays, prognostic assays, pharmacogenomics and for monitoring clinical trials. TANGO polypeptides are sultable for both prophylactic and therapeutic methods for treating a subject at risk of a disorder or having a disorder associated with aberrant TANGO expression. A wide range
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel nucleic acid sequences encoding TANGO-128, 140, 197, 212, 213, 224 and 239 polypeptides useful for the treatment of asthma, rheumatoid arthritis, psoriasis and autoimmune diseases
inflammatory bowel disease; septic shock; ulcerative colitis; Crohn's disease; chronic myelogenous leukemia; cancer; liver disease; hodgkin's disease; osteoarthritis; Lyme's disease; cachexia; autoimmune disease; myasthemia gravis; autoimmune diabetes; systemic lupus erythematosus; transgenic animal; diagnosis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to human nucleic acids (AAIS)798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with hootropic, immunosuppressant and cytostatic activity. The polypucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin, Inhibin activity, chemotactic/chemokinetic activity, haemostatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequence data for this patent did not form part of the printed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Wang D;

                                                                                                                                                                                                              οy
                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes primer sets for synthesising 5602

[ull-length cDNAs defined in the specification. Where a primer set
complaises: (a) an oligo-dT primer and an oligonuclectide complementary
to the complementary strand of a polynuclectide comprises one of
the 5602 nucleotide sequences defined in the specification, where the
cligonucleotide comprises at least 15 nucleotides; or (b) a combination
of an oligonucleotide comprising a sequence complementary to the
complementary strand of a polynucleotide which comprises a 5'-end
sequence and an oligonucleotide comprising a sequence complementary to a
polynucleotide which comprises a 3'-end sequence of the combination of
the 5'-end sequence/3'-end sequence is selected from those defined in
the specification. The primer sets can be used in antisense therapy and
in gene therapy. The primers are useful for synthesising polynucleotides,
particularly full-length cDNAs. The primers are also useful for the
clin end of diagnosis of the abnormality of the proteins encoded by
the full-length cDNAs. The primers allow obtaining of the full-length
cDNAs easily without any specialised methods. AAH03165 to AAH13628 and
AAH13633 to AAH13642 represent human anino acid sequences; and AAH13629 to AAH13632
represent child, and of the abnormality of the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs -

The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Wang D;

                               The invention relates to human nucleic acids (AAIS)798-AAI61369) and the encoded polypeptides (AAM3642-AAM42213) with hootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activinhibin activity, chemotactic/chemokinetic lactivity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, as assays for receptor activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Transcriptional regulator; transcription; BAZ1-alpha; bromodomain; BAZ; atypical zinc finger; testis; human; tumour; BAZ1-beta; BAZ2-alpha; drug; BAZ2-beta; treatment; cancer; proliferative disorder; screening.

```
This sequence represents the human BAZ2-alpha protein, a member of a family of transcriptional regulator genes containing a bromodomain (BAZ, Bromodomain with Atypical Zinc finger) which are expressed specifically in testis tissue and also in certain tumour lines. Transgenic cells may be used for the preparation of the BAZ1-alpha, BAZ1-beta, BAZ2-alpha and BAZ2-beta proteins. These proteins can be used in the treatment of cancer and other proliferative disorders, and in screening of compounds for their binding ability to the expression products (e.g. for use as drugs by modulation of transcriptional regulation).
                                                                    Transcriptional regulator gene family containing bromodomain - may
be expressed in testis tissue and is useful for treatment of cancer
and other proliferative disorders
                                                                                                                                                                  Claim 1; Page 72-88; 187pp; Japanese.

                                                                                                VEGFR-3 and VEGFR-2. VEGF-D first form an antiparallel homodimer linked by disulfide bonds before secretion. The fully processed VEGFR-1 is composed mostly of two VEGF homology domains (VHDs) bound by non-covalent interaction.
SUBCELLULAR LOCATION: Secreted.
TISSUE SPECIFICITY: Highly expressed in lung, heart, small intestine and fetal lung, and at lower levels in skeletal muscle,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CPIDMLWDSNKCKCVLQEENPLAGTEDHSHLQEPALCGPHMMFDEDRCECV-CKTPCPKD 280

                                                                                                                  AND PCSA/SHORT; ARE PRODUCED BY ALTERNATIVE SPLICING.

-1 TISSUE SPECIFICITY: PCSA IS EXPRESSED IN MOST TISSUES BUT IS MOST ABUDANT IN THE INTESTINE AND ADRENALS. PCSB IS EXPRESSED IN THE MUDANT IN THE INTESTINE AND LOWE BUT NOT IN THE BRAIN.

-1 DEVELOPMENTAL STAGE: WEAKLY EXPRESSED THROUGHOUT THE EMBRYO, EXCEPT IN THE DEVELOPING NERVOUS SYSTEM, THE RIBS AND THE LIVER, BUT WARKEDIX UPREGULATED A DISCRETE SITES DURING DEVELOPMENT. AT E6.5, PROMINENT EXPRESSION OBSERVED IN DIFFERENCIATED DECIDUA. AT E7.5, INTERNE EXPRESSION IN EXTRABUBRYONIC ENDODERW, ANNION AND NASCENT MESODERW. AT 8.5, ABUDANT EXPRESSION IN SOMITES AND YOLK SAC FOLLOWED BY A CONFINATION TO DERMANOTOME COMPARTMENT. BETWEEN E9.5 AND E11.5, ABUDANT EXPRESSION IN THE LIMBS IS CONFINED COLLOWER SERVED. OF LIMB BUDS). AT E12.5, EXPRESSION IN THE LIMBS IS CONFINED STAGE. STRONG BESENCHINK SURROUNDING THE CARTILAGE. AT THIS STAGE. STRONG EXPRESSION ALSO DETECTED IN VERTEBRAL AND FACIAL
                                                                                                                                                                                                                                                                                                                                                                                           CARTILAGE PRIMORDIA AND IN THE MUSCLE OF THE TONGUE. AT E16.5, ABUNDANT EXPRESSION IN EPITHELIAL CELLS OF THE INTESTINAL VILLI. STOOFDAM A IS MOST ABUNDANT AT ALL STAGES BUT SIGNIFICANT LEVELS OF DOMAIN: THE PROPEPTIED DOMAIN ACTS AS AN INTRAMOLECULAR CHAPERONE ASSISTING THE FOLDING OF THE ZYMOGEN WITHIN THE ENDOPLASMIC
                  CAN BE ANY AMINO ACID AND YAA IS ARG OR LYS.
SUBCELLUIALB LOCATION: PCSA IS SECRETED THROUGH THE REGULATED
SECRETORY PATHWAY. PCSB IS A TYPE I MEMBRANE PROTEIN LOCALIZED TO
A PARANUCLEAR POST-GOLGI NETWORK COMPARTMENT IN COMMUNICATION WITH
 PROPROTEINS BY CLEAVAGE OF ARG-XAA-YAA-ARG-|-ZAA BONDS, WHERE XAA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     DOMAIN: AC 1 AND AC 2 (CLUSTERS OF ACIDIC AMINO ACIDS) CONTAIN SORTING INFORMATION. AC 1 DIRECTS TGN LOCALIZATION AND INTERACTS WITH THE TGN SORTING PROTEIN PACS-1.

SIMILARITY: BELONGS TO PEPTIDASE FAMILY S8; ALSO KNOWN AS THE

TERMINUS. PACE4 MIGHT BE SECRETED.

-1- ALTERNATIVE PRODUCTS: 8 ISOFORMS; PACE4A-I/PACE4 (SHOWN HERE),
PACE4A-II, PACE4, PACE41, PACE4C., PACE4CS, PACE4CS, PACE4D.)
PACE4E-II; ARE PRODUCED BY ALTERNATIVE SPLICING. ISOFORMS PACE4B,
C, CS AND D MIGHT BE ENZYMATICALLY INACTIVE.
-1- TISSUE SPECIFICITY: EACH PACE4 ISOFORM EXHIBITS A UNIQUE
RESTRICTED DISTRIBUTION. PACE4A-I IS EXPRESSED IN HEART, BRAIN,
PLACENTA, LUNG, SKELETAL MUSCLE, KIDNEY, PANCREAS, BUT AT
COMPARATIVELY HIGHER LEVELS IN THE LIVER. PACE4A-II IS AT LEAST
EXPRESSED IN PLACENTA, PACE4B WAS ONLY FOUND IN THE EMBRYONIC
KIDNEY CELL LINE FROM WHICH IT WAS ISOLATED. PACE4C AND PACE4D ARE
EXPRESSED IN PLACENTA. PACE4E-I IS EXPRESSED IN CERRBELLOM,
PLACENTA AND PITUITARY. PACE4E-I IS SYPRESSED IN CERRBELLOM,
                                                                                                                                                                                                                                                                                                                                                                                                                                                            This SWISS-PROT entry is copyright. FOR VCAM1 AND RECOGNIZES THE SEQUENCE 0-1-D-S IN VCAM1. INTEGRIN ALPHA-9/BETA-1 IS A RECEPTOR FOR VCAM1, CYTOTACTIN AND OSTEDOPNIN. IT RECOGNIZES THE SEQUENCE A-E-1-D-G-T-E-L IN CYTOTACTIN. INTEGRIN ALPHA-3/BETA-1 IS A RECEPTOR FOR EPILIGRIN AND THROMBOSPONDIN. INTEGRIN ALPHA-V/BETA-1 IS A RECEPTOR FOR VITRONECTIN. BETA-1 INTEGRINS RECOGNIZE THE SEQUENCE R-G-D IN A SUBDINIT: HETERODIMEN OF AN ALPHA AND A BETA SUBUNIT. BETA-1 ASSOCIATES WITH EITHER ALPHA-1, ALPHA-2, ALPHA-3, ALPHA-4, ALPHA-6, ALPHA-7, ALPHA-8, ALPHA-9, ALPHA-10, ALPHA-11 OR
                                                                                                                                                                                   -!- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN. ISOFORM BETA-1B DOES NOT LOCALIZE TO FOCAL ADHESIONS.
-!- PTM: THE CYSTEINE RESIDUES ARE INVOLVED IN INTRACHAIN DISULFIDE
                                                                                                                                                                                                                                                                                                                                                                                                                              EMBL; U10865; AAA80571.1; -.

Expression during of a murine fibronectin receptor and its expression during inflammation. Expression of VLA-5 is increased in a retracted eperitoreal macrophages in a manner discordant from major and its deperitoreal macrophages in a manner discordant from major and its histocompatibility complex class II.";

J. Exp. Med. 169:1589-1605(1989).

-1 FUNCTION: LIKELY TO REPRESENT A WIDESPREAD ENDOPROTEASE ACTIVITY
WITHIN THE CONSTITUTIVE AND REGULARED SECRETORY PATHWAY. CAPABLE
COFCLEAVAGE AT THE RX(K/R)R CONSENSUS MOTIF.

COFCLEAVAGE AT THE RX(K/R)R CONSENSUS MOTIF.

-1 CATALYTIC ACTIVITY: RELEASE OF MATURE PROTEINS FROM THEIR
PROPROTEINS BY CLEAVAGE OF ARG. YAA. TRA. ARG. | ZAA BONDS, WHERE XAA
CAN BE ANY AMINO ACID AND YAA IS ARG OR LYS.

-1 SUBCELLULAR LOCATION: Secreted (By similarity).

-1 ALTERNATIVE PRODUCTS: 2 ISOFOMNS SEEMS TO BE PRODUCED BY
ALTERNATIVE SPLICING.

-1 ALTERNATIVE SPLICING.

-1 TISSUE SPECIFICITY: EXPRESSED IN T-LYMPHOCYTES.

-1 DOMAIN: THE PROPEPTIDE DOMAIN ACTS AS AN INTRAMOLECULAR CHAPERONE
ASSISTING THE FOLDING OF THE ZYMOGEN WITHIN THE ENDOPLASMIC

Cytoplasmic domain of the 75 kDa tumor necrosis factor receptor.";
-: FUNCTION: SIGNAL TRANSDUCER ASSOCIATED WITH THE CYTOPLASMIC DOMAIN OF THE 75 kDa TUMOR NECROSIS FACTOR RECEPTOR (TNF-R2) AND ACTIVATES NF-KAPPA-B.
-: SUBUNIT: HOWODIMER OR HETERODIMER OF TRAFI AND TRAF2. THIS HETEROCOMPLEX CAN BIND TO THE N-TERMINAL OF INHIBITOR OF APOPTOSIS FACTOR RECEPTOR 2 (TNFR2), TO RECRUIT THEM TO THE TUMOR NECROSIS FACTOR RECEPTOR 2 (TNFR2).
                                                                                                                                                                                                                                                                                                                                                                                                                                     24; Gaps

SUBCELLULAR LOCATION: Type I membrane protein.

DOMAIN: THE CYTOPLASMIC PART OF THE RECEPTOR MAY INTERACT WITH THE SH2 OR SH3 DOMAINS OF MANY SIGNAL-TRANSDUCING PROTEINS.

PTW. LIGAND-BINDING INCREASES PHOSPHORYLATION ON TYROSINE RESIDUES PHOSPHATIDYLINOSITOL 3-KINASE.

SIMILARITY: BELONGS TO THE EGF RECEPTOR FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ERBB-3 RECEPTOR PROTEIN-TYROSINE KINASE. J. BIOCHEM. 177:35-45(1988).

-!- FUNCTION: BINDING TO CELLS VIA A HIGH AFFINITY RECEPTOR, LAMININ IS THOUGHT TO MEDIATE THE ATTACHMENT, MIGRATION, & ORGANIZATION OF CELLS INTO TISSUES DURING EMBRYONIC DEVELOPMENT BY INTERACTING WITH OTHER EXTRACELLULAR MATRIX COMPONENTS.
-!- SUBUNIT: LAMININ IS A COMFLEX GLYCOPROTEIN, CONSISTING OF THREE DIFFERENT POLYPEPRIDE CHAINS (ALPHA, BETA, GAMMA), WHICH ARE BOUND TO EACH OTHER BY DISULFIDE BONDS INTO A CROSS-SHAPED MOLECULE COMPRISING ONE LONG & THREE SHORT ARMS WITH GLOBULES AT EACH END.
THE ALPHA-1 CHAIN IS A SUBUNIT OF LAMININ-1 (EHS LAMININ) AND
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DOMAIN: THE ALPHA-HELICAL DOMAINS I AND II ARE THOUGHT TO INTERACT WITH OTHER LAMININ CHAINS TO FORM A COILED COIL STRUCTURE.

DOMAIN: DOMAINS VI, IV AND G ARE GLOBULAR.
SIMILARITY: CONTAINS I LAMININ N-TERMINAL DOMAIN (DOMAIN VI).
SIMILARITY: CONTAINS 2 LAMININ DOMAINS IV.
SIMILARITY: CONTAINS 2 LAMININ DOMAINS IV.
SIMILARITY: CONTAINS 5 LAMININ G-LIKE DOMAINS.

-!- FUNCTION: BINDING TO CELLS VIA A HIGH AFFINITY RECEPTOR, LAMININ

-!- FUNCTION: BINDING TO CELLS VIA A HIGH AFFINITY RECEPTOR, LAMININ

-!- STHOUGHT TO MEDIATE THE ATTACHMENT, MIGRATION, & ORGANIZATION OF

CELLS INTO TISSUES DURING EMBRYONIC DEVELOPMENT BY INTERACTING

MITH OTHER EXTRACELLULAR MATHIX COMPONENTS.

-!- SUBUNIT: LAMININ IS A COMPLEX GLYCOPROTEIN, CONSISTING OF THREE

DIFFERENT POLYPEPTIDE CHAINS (ALPHA, BETA, GAMMA), WHICH ARE BOUND

TO EACH OTHER BY DISULFIDE BONDS INTO A CROSS-SHAPED MOLECULE

COMPRISING ONE LONG & THREE SHORT ARMS WITH GLABULES AT EACH END.

THE ALPHA-Z. CHAIN IS A SUBUNIT OF LAMININ-2 (MÉROSIN) AND LAMININ-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                MEMBRARES (WAJOR COMPONENT).

-1 TISSUE SPECIFICITY: PLACENTA, STRIATED MUSCLE, PERIPHERAL NERVE, CARDIAC MUSCLE, PANCREAS, LUNG, SPLEEN, KIDNEY ADRENAL GLAND, SKIN, TESTIS, MENINGES, CHOROID PLEXUS, AND SOME OTHER REGIONS OF THE BRAIN; NOT IN LIVER, THYMUS AND BONE.

-1 DOMAIN: THE ALPHA-HELICAL DOMAINS I AND II ARE THOUGHT TO INTERACT WITH OTHER LAMININ CHAINS TO FORM A COLLED COLL STRUCTURE.

-1 DOMAIN: DOMAINS VI, IV AND G ARE GLOBULAR.

-1 DISEASE: DEFECTS IN LAWAZ ARE THE CAUSE OF MEROSIN-DEFICIENT CONGENITAL MUSCULAR DYSTROPHY (MCMD).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Vuolteenaho R., Nissinen M., Sainio K., Byers M., Eddy R.,

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                        1;
                                                                            This is the amino acid sequence of the N-terminal, i.e. the extracellular, domain of novel human transmembrane activator and caxtracellular, domain of novel human transmembrane activator and caxtracellular, domain of novel human transmembrane activator and caxtracellular is involved in Taxti sa lymphocyte receptor protein that is involved in a much lesser extent it is normally present in B-lymphocytes, and to a much lesser extent in immature T-lymphocytes, and can therefore be targetted to specifically regulate B cell responses without affecting T cell activity. The extracellular domain of Taxi functions as a binding site for a ligand that stimulates the activation of the cell by inducing the binding of the C-terminal portion (see Amy7784) of Taxi to the N-terminal domain of CAMI. A recombinant form of the caxtracellular portion of TAXI acts as a dominant-negative or blocking agent and acts to suppress the immune system. It can be used to treat or prevent autoimmune disease, graft rejection or careful versus host disease. The extracellular region is also used in a claimed method for identifying a ligand for TAXI, in which cativation of the AP-1, CAMP or NF-KB pathway, of NF-AT cranscription.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          antagonists to modulate the activity of the members of TNF (tumour necrosis factor) especially TALL-1, APRIL and TNF receptor (TNFR) e.g. TACI or BGMA. The method is useful for treating pathological conditions or diseases associated with increased TALL-1 and APRIL expression or activity. TALL-1 and APRIL antagonists are used to block the interaction between APRIL and TALL-1 with TACI or BCMA. They are useful for treating a mammal suffering from cancer such as leukaemia, lymphoma, myeloma, cancers of lung and colon and autoimmune diseases e.g. rheumatoid arthritis, multiple sclerosis, psorlasis and lupus erythematosus. The present sequence is human
                                                          Inhibiting or neutralizing TALL-1 or APRIL polypeptide biological activity, for treating autoimmune disorders and cancer, comprises exposing the cells to TALL-1 or APRIL polypeptide agonists or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 TACI; transmembrane activator and CAML-interactor; calcium signal-modulating cyclophilin ligand; human; lymphocyte surface receptor; human; B-cell; B lymphocyte; infection; cancer; rheumatoid arthritis; autoimmune disease; glomerulonephritis; lamunosuppressive; graft versus host disease; transplant rejection; therapy.
                                                                                                                                                                                                                                                                            The invention relates to methods of using one or more agonists or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Score 393; DB 22; Length 265;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ŏ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ä
                                                                                                                                                                                                                                                                     cativator and CAML-interactor (TACI) protein, a lymphocyte receptor protein that is involved in the calcium activation pathway. TACI is normally present in B-lymphocytes, and to a much lesser extent in immature T-lymphocytes, and can therefore be targetted to specifically regulate B cell responses without affecting T cell activity. TACI cDNA (seev57328) was isolated from a B-lymphocyte convaling a yeast two-hybrid assay. Also claimed are activity. TACI cDNA (seev57328) was isolated from a B-lymphocyte convaling a yeast two-hybrid assay. Also claimed are the C-terminal (see AAW75784) and N-terminal (see AAW75785) fragments of TACI, recombinant DNA constructs, unicellular hosts, and antibodies to TACI and for identifying immunosuppressive drugs that selectively block the action of B lymphocytes without affecting injand for TACI and for identifying immunosuppressive drugs that selectively block the action of B lymphocytes immune system activity, e.g. for treating infections or cancers. It can be blocked to provide immunosuppression, e.g. for treating infections and inflammatory conditions such as immune complexing mysthenia gravis, type II collagen-induced arthritis, experimental mysthemia gravis, type II collagen-induced arthritis, experimental systemic lupus erythematosus, transplant rejection, cancer or system.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    immunosuppressive; nootropic; neuroprotective; antiviral; antiallergic; hepatotropic; antidiabetic; antiinflammatory; antiulcer; cardiant; ophthalmological; gene therapy; immunodeficiency disorder; diagnosis; autoimmune disorder.

TR17 has cytostatic, immunosuppressive, nootropic, neuroprotective, antiviral, antiallergit, hepatotropic, antidiabetic, antiinflammatory, antiulcer, cardiant and ophthalmological activities and can be used in gene therapy. The TR17 protein and antibodies are useful for treating and diagnosing immunodeflociency polynucleotides, antibodies, agonists and/or antagonists are used for treating various other diseases defined in the specification and as research tools for studying the phenotypic effects that result from inhibiting TR17/TR17 ligand interactions on various cell types.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Nucleic acid encoding a neutrokine-alpha receptor (NAR) such as TR17, useful for producing TR17 protein which is used in the treatment and diagnosis of autoimmune and immunodeficiency disorders -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             4; Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to methods of using one or more agonists or antagonists to modulate the activity of the members of TNF (tumour necrosis factor) especially TALL-1, APRIL and TNF receptor (TNFR) e.g. TACI or BCMA. The method is useful for treating pathological conditions or diseases associated with increased TALL-1 and APRIL block the interaction between APRIL and APRIL APRIL APRIL APRIL AND APRIL AND APRIL AND APRIL AND APRIL AND APRIL A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Inhibiting or neutralizing TALL-1 or APRIL polypeptide biological activity, for treating autoimmune disorders and cancer, comprises exposing the cells to TALL-1 or APRIL polypeptide agonists or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present Sequence Teppersons a numer transmender activator and compared to the present Sequence Teppersons of BR43x2 (an isoform of TACI). Teceptor. The extracellular domains of BR43x2 (an isoform of TACI), TACI coreptor. The extracellular domains of BR43x2 (an isoform of TACI), TACI domain, and are used for inhibiting atthick activity. Zurif is a TNF ligand. They may also be used for inhibiting BR43x2, TACI or BCMA creeptor-ligand engagement associated with activated or resting B lymphocytes, effector T-cells, or with antibody production. The associated with an autoimmune disease selected intubody production is associated with an autoimmune disease selected from systemic lupus erythematosus, myasthenia gravis, multiple sclerosis and rheumatoid arthritis. The Zurif activity and BR43x2, TACI or BCMA receptor-ligand engagement is associated with asthma, bronchitis, emphysema, end stage renal failure, glomerulonephritis, vasculitis, ceptor-ligand engagement is associated with asthma, bronchitis, ceptor-ligand engagement glalure, glomerulonephritis, ransl neoplasms, multiple myelomas, lymphomas, limpuncouppression, graft rejection, graft versus host disease, inflammation, insulin dependent diabetes mellitus. Crohn's disease, joint pain, swelling, anaemia, or septic shock, BR43x2, TACI, and BCMA polypeptides, fusions, antibodies, agonists or antagonists can be used to treat hypertension, renal artery stenosis, or occlusion, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ä

The present sequence is a human tumour necrosis factor receptor (TACI) protein. TACI (Transmembrane activator and calcium-signal modulating cyclophilin ligand (CAMI-) interactor) forms a complex with neutrokine alpha polypeptide (TACI-Ligand). The antagonist or agonist of TACI/TACI-L complex is useful for modulating an intracellular signalling cascade mediated by TACI/TACI-L complex. Antagonists of TACI/TACI-L for therapeutic purposes to intact the interaction between TACI and TACI-L for therapeutic purposes to treat tumour and tumour metastasis and to combat various autoimmune diseases e.g. multiple sclerosis and diabetes, as well as other disorders, such as viral infection, rheumatoid arthritis, graft rejection, and immunoglobulin (Ig) E-mediated allergic reactions and inflammation. The interaction is used to study cellular processes as sociated with tumour necrosis factor (TNF)-receptors such as immune regulation, cell proliferation, cell death and inflammatory responses. The interaction between the extracellular region of TACI and TACI-L can and the complex and the

The present sequence represents murine ztnf4, a tumour necrosis factor ligand. The extracellular domains of BR432 (an isoform of the transmembrane activator and CAML-interactor (TACI) receptor). TACI or BCMA (a related B cell protein) contain a cysteine rich domain, and are used for inhibiting BR432, TACI or BCMA receptor-ligand engagement associated with activated or resting B lymphocytes, effector f-cells, or with antibody production. The antibody production is associated with an autoimmune disease selected from systemic lupus erythematosus, myasthenia gravis, multiple sclerosis and rheumatold arthritis. The ztnf4 activity and BR332, TACI or BCMA receptor-ligand engagement is associated with a autoimmune disease selected from systemic lupus erythematosus, myasthenia gravis, multiple sclerosis and rheumatold arthritis. The ztnf4 activity and BR332, TACI or BCMA receptor-ligand engagement is associated with a sthma. bronchitis, emphysema, end stage renal failure, glomerulonephritis, vascullitis, nephritis, pyelonephritis, renal neoplasms, multiple myelomas, lymphomas, light chain neuropathy, amyloidosis, moderating immune response, immunosuppression, graft cribic specific shock. BR4322, TACI, and BCMA polypeptides, fusions, antibodies, ceptic shock. BR4322, TACI, and BCMA polypeptides, fusions, antibodies, septic shock. BR4322, TACI, and BCMA polypeptides, fusions, antibodies, septic shock. BR4322, TACI, and became to treat hypertension, renal artery stenosis, or occlusion, and cholesterol or renal emboli.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Inhibiting ztnf4 activity in a mammal, to treat autoimmune diseases, renal disease, graft versus host disease, and inflammation, comprises administering a BR43x2, TACI or BCMA extracellular domain polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Nucleic acids encoding 26 human secreted polypeptides, useful e.g. for preventing, diagnosing and/or treating cancers and for promoting wound
                light chain neuropathy, amyloidosis, moderating immune response, immunosuppression, graft rejection, graft versus host disease, inflammation, insulin dependent diabetes mellitus, Crohn's disease, pain, swelling, anaemia, or septic shock. BR43x2, TACI, and BCMA polypeptides, fusions, antibodies, agonists or antagonists can be us to treat hypertension, renal artery stenosis, or occlusion, and cholesterol or renal emboll.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   proteins may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate polypeptide expression. For example, they may be used in gene therapy or in vaccines. Typical of diseases which are potentially treatable are cancers (including leukemia), autoimmune diseases, allergies, inflammation, graft rejection, hyperproliferation, cardiovascular diseases in particularly critical limb ischemia and coronary disease involving abnormal anglogenesis, neurodegeneration and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to 26 secreted human proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Secreted protein; gene therapy; vaccine; cancer; leukemia; autoimmune disease; allergy; inflammation; graft rejection; hyperproliferation; cardiovascular; infection.

TACI is a tumour necrosis factor (TNF) receptor. The extracellular domains of BR43x2 factor DEMA (a related B cell protein) contain a cysteine rich domain, and are used for inhibiting zuhf activity. Zinf4 is a TNF ligand. They may also be used for inhibiting BR43x2, TACI or BCMA receptor-ligand engagement associated with activated or resting B lymphocytes, effector T-cells, or with antibody production. The antibody production is associated with an autoimmune disease selected from systemic lupus erythematosus, myasthenia gravis, multiple sclerosis and rheumatoid arthritis. The zinf4 activity and BR43x2, TACI or BCMA receptor-ligand engagement is associated with asthma, bronchitis, emphysema, end stage renal failure, glomerulonephritis, vasculitis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              renal disease, graft versus host disease, and inflammation, comprises administering a BR43x2, TACI or BCMA extracellular domain polypeptide

collateral circulation in tissue infarction or arterial stenosis, such as coronary artery disease, and inhibition of angiogenesis in the treatment of cancer or of diabetic retinopathy. It can also be used in the treatment of lung disorders to improve blood circulation in the lung and/or gaseous exchange between the lungs and the blood is stream or to improve blood circulation to the heart and 02 gas permeability in cases of cardiac insufficiency, to improve blood flow and gaseous exchange in chronic obstructive airway disease, or to treat malabsorptive syndromes in the intestinal tract. Quantitation of VEGF-D in cancer biopsy specimens may be useful as an indicator of future metastatic risk. Antagonists can be used for treating e.g. conditions such as congestive heart failure, involving accumulations of fluid in the lung resulting from increases in vascular permeability. The products can also be used for detection and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; angiogenic protein; wound healing; vascular tissue repair; peripheral arterial disease; critical limb ischaemia; coronary disease; angiogenesis; tumour; inflammation; diabetic retinopathy; psoriasis; rheumatoid arthritis; autoimmune disease; allergy; cancer; therapy; infectious disease; neurodegeneration;

and the DNA sequences encoding them a invention. The anglogemic procession of the DNA sequences encoding them a invention. The anglogemic procession and to detect diseases, or susceptibility, by detecting mutations or the presence or amount of anglogemic protein electring mutations or the presence or amount of anglogemic protein expression. Particularly they are used to stimulate wound healing, growth of damaged bone and tissue, and for repair of vascular tissue, especially peripheral arterial disease, critical limb ischaemia or coronary disease. Antagonists of the sequences are used to inhibit anglogemesis in tumours and to treat inflammation (where associated with increased vascular permeability), diabetic retinopathy, rhemmatoid arthritis or psoriasis. Agonists are also used to identify specific increased vascular proteins are also used to identify specific binding agents (potential therapeutic gants) and to raise antibodies. The proteins are also used to identify specific binding agents (potential therapeutic gants) and to raise antibodies. The antibodies are useful as therapeutic (antibognists; for detection, purification and targeting of proteins for in vivo or in vitro diagnosis (including imaging) or for therapey (including when linked to e.g. a label or cytotoxin); and for immunotyping of cells, e.g. for detecting minimal residual disease or haematopoletic progenitor/stem cells. It is also contemplated that the sequences might be useful for treating a very wide range of other disorders, e.g. autoimmune diseases; allergy; cancer; infectious diseases (viral, bacterial, fungal or parasitic); neurodegeneration, also as chemotactic agents or for stimulating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1;

The present sequence represents a human zvegf2 growth factor encoded by the zvegf2 cDNA which was isolated from a human heart CDNA library zvegf2 protein in a dimeric form acts as a mitogen for fibroblasts or smooth muscle cells. zvegf2 is claimed to be useful for stimulating the revascularisation of tissue or the re-endothelialisation of vascular tissue. zvefg2 is particularly claimed to be useful for the treatment of full-thickness skin wounds, including venous stasis ulcers and diabetic ulcers. The zvegf2 protein is also claimed to be useful as an additive in tissue adhesives for promoting revascularisation of the healing tissue. Antagonists against zvegf2 can be used to block its mitogenic, chemotactic and anglogenic effects. The antagonists may
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            mitogenic, chemotactic and angiogenic effects. The antagonists may therefore be useful for reducing growth of solid tumours by inhibiting neovascularisation of the developing tumour or by directly blocking tumour cell growth, in the treatment of diabetic retinopathy, psoriasis,

                                                                                                                                                                                                                                                                                                                                                                                             The sequence is that of human lung vascular endothelial growth factor D (VEGF-D). VEGF-D can be used for e.g. acceleration of angiogenesis in wound healing, tissue or organ transplantation, or to establish collateral circulation in tissue infarction or arterial stenosis, such as coronary artery disease, and inhibition of angiogenesis in the treatment of cancer or of diabetic retinopathy. It can also be used in the treatment of lung disorders to improve blood circulation in the lung and/or gaseous exchange between the lungs and the blood in the lung and/or gaseous exchange between the lungs and the blood cremability in cases of cardiac insufficiency, to improve blood flow and gaseous exchange in chronic obstructive airway disease, cor to treat malabsorptive syndromes in the intestinal tract.

Ountitation of VEGF-D in cancer blopsy specimens may be useful as an indicator of future metastatic risk. Antegonists can be used involving accumulations of fluid in the lung resulting from increases in vascular permeability. The products can also be used for detection and diagnosis.

The VEGF-D protein, compounds and antibodies, which can bind the protein, may be useful in, e.g. gene therapy and in treatment of inflammation and oedema. Vectors, containing the VEGF-D DNA, and VEGF-D DNA sequences may be used for screening for the compounds which bind to the VEGF-D protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

Sequence 2, Application US/09290333
Patent No. 5316222
GENERAL INFORMATION:
APPLICANT: Bram, Richard J.
TITLE OF INVENTION: A LYMPHOCYTE SURFACE RECEPTOR THAT BINDS
CAML, NUCLEIC ACIDS ENCODING THE SAME AND METHODS OF USE
                                                                             Sequence 2, Application US/08810572A
Patent No. 5969102
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Von Bullow, Gotz
TITLE OF INVENTION: AL YMPHOCYTE SURFACE RECEPTOR THAT BINDS
TITLE OF INVENTION: CAML, NUCLEIC ACIDS ENCODING THE SAME AND METHODS OF USE
TITLE OF INVENTION: THEREOF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ij

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                GENERAL INFORMATION:
APPLICANT: Barr, Philip J
APPLICANT: Kiefer, Michael C
APPLICANT: Kiefer, Michael C
TITLE OF INVENTION: Compositions and Methods for PACE 4 and 4.1 Gene and
TITLE OF INVENTION: Polypeptides in Cells
                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                 7;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       14 CMSCKT-ICNHQSQRTCAAFCCRKEQGKFYDHLLRDCISC---ASICGQHPKQC 63
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          14 CMSCKT-ICNHQSQRTCAAFCCRKEQGKFYDHLLRDCISC---ASICGQHPKQC 63
                                                                                                                                                                                                                                                                       Sequence 2, Application US/08447642
Patent No. 599890
GENERAL INFORMATION:
APPLICANT: BARK, PHILIP J
APPLICANT: KIEFER, MICHAEL C
TITLE OF INVENTION: COMPOSITIONS AND METHODS FOR PACE 4 AND
TITLE OF INVENTION: PACE 4.1 GENE AND POLYPEPTIDES IN CELLS
NUMBER OF SEQUENCES: 16
CORRESPONDENCE ADDRESS:
ADDRESSEE: COOLEY GODWARD CASTRO HUDDLESON & TATUM
STREET: FIVE PALO ALTO SQUARE
CITY: PALO ALTO ALTO SQUARE
18.4%; Score 74.5; DB 2; Length 969; 27.8%; Pred. No. 2.3;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Length 969;
